The calculation is based on pure rotational data from Koga *et al.*, 1989, J. Mol. Spect. **138**, 467 and on infrared data from the high resolution spectrum of the  $\nu_1$  band to be published by Cohen *et al.* The maximum value of  $K_a$  observed in the infrared is 5. The reader is cautioned that transitions involving higher values  $K_a$  in the catalog are extrapolations which may be considerably less accurate than the calculated uncertainties indicate.
